AGRICULTURAL.

Treatment of Scours.—Some time ago a steer belonging to a neighbor of mine was troubled with scours (diarrhea). Upon examination it was found that it came on at a certain hour each day or night; it appearing the fore part of each night. The matter was called to the attention of a physician visiting in the neighborhood, with a description of the case. He saw the steer and seemed to make a point about the time of the attack. He then separated him from the herd and began a course of treatment, giving the steer in bran and salt sulphate of Cinchonidia. He began this with 5 grain doses and increased it until 25 grains three times a day were given. The last dose he gave was about 60 grains. Much to the surprise of all, the scours were completely stopped and the steer began to pick up at once, and is now doing well, although, up to this, he had done on good. It was also tried on a calf with periodical diarrhoeas, with the same result. The theory being, that the cause was malaria. It was new to us, and the two cases in question has excited much comment with those who knew the circumstances. We think it worthy of a trial in districts where ague abounds.

Raccoon, Ind. FARMER.
Turkey Raising.—I would like to know how to raise turkeys. I have tried it several times and failed. When they get to be a few weeks old their toes begin to turn in, and they gradually lose the use of their limbs and die. I would like to know what is the cause, and please inform me what is the remedy, if there be any. I have been told that they would never do well on a board floor. I have them cooped this year on sod. I have some four weeks old; their toes are turning in badly. I raise them with hens and feed them with curds and a little corn meal at times, also boiled eggs. Please answer and oblige.
111, June 10.

Answer.—The leg-weakness among young turkeys is probably caused by lack of the bone-forming element in their food. It can be prevented, but not cured. Feed your young turkeys curds, hard-boiled eggs, and bread crumbs for three or four days after hatching; afterwards feed well cooked corn-meal, mixed with curds and seasoned with black pepper, all they will eat five or six times a day. Bone-meal twice a week, one table-spoonful to a pint of feed, will be beneficial; give sour milk to drink, and best of all give your young turkeys free range every pleasant day as soon as the dew is off the grass.

The value of Clover.—I claim that I can take a field that has become so exhausted in fertility that it will not produce a profitable crop of anything without a heavy dressing of manure, and in two years' time I will make it fertile with clover alone, and without any manure whatever, except what the roots of the clover and clover green crop turned under may supply. A farmer says: "The roots of clover average a depth of sixteen inches, which remain within the range of all crops, hence the great utility and profit of this wonderful crop. On all our soils that need renovating, especially, our clay soils, whenever we seed down either for meadow or for pasture, whatever our mixture of seeds, we must not omit the common red clover, which has had a beneficial influence upon American agriculture that it is impossible to overestimate. Gypsum or land plaster should always be sown on this crop, because of the wonderful increase in the bulk of the crop that is always found to result from the application of so small an amount as say one hundred pounds to the acre, sown when the plants are two or three inches high, and moist with dew or light rain." Yes clover is a "wonderful crop" to renovate land, and farmers should try to save all the seed they want from the second blossoms of the season, which may be done without buying a "bulder," by cutting the clover when the blossoms are dry; carry it carefully to your barn floor, and thresh it out, cleaning the seed in a fanning mill.—
Letter to Exchange.

Experiments with Corn and Manure.—The Illinois Industrial University, at Champaign, made an experiment with thirteen different fertilizers on twenty plants of corn. The highest yield was from barn manure. Twenty loads on one acre yielded 68.60 bushels (of 70 pounds dry per bushel). The lowest yield was with potash and superphosphate of lime—70.81 bushels of corn. The highest yield without fertilizer was 80.85 bushels, and the average of all the plots was 79.11 bushels of corn. It was harvested soon after the fertilizers were applied. June 10th it was cultivated, and again June 24th, when it was thinned to two stalks to the hill. July 3d cultivated, and cultivated and laid by July 4th. This was all one way, north and south. October 28th 29th and 31st, the crop was gathered and weighed, also weighing eighty pounds of ears to the bushel. The land was never before manured and had never been in grass. Had been in corn most of the time for twenty-five or thirty years. The corn, as stated, was gathered October 31st, and 80 pounds were shoveled from the load and carefully preserved. November 20th it weighed 78 pounds; December 20th, 76 pounds; January 12th, 76 pounds. It then appeared dry, and was shelled and gave 63 pounds of corn and 12 pounds of cobs, showing that 70 pounds should have been taken for a bushel.—Independent.
